Abstract not available for JP 2002513430 (A)

Abstract of corresponding document: WO 9832795 (A1)

Rheology-modified TPE compositions are prepared by peroxide modification of a melt blend of an EAO polymer or EAO copolymer blend and a high melting polymer such as polypropylene or a propylene/alpha-olefin copolymer. The resulting compositions have an elastomeric phase, a non-elastomeric phase and certain physical properties that exceed those of a like composition that is not rheology-modified or of the same composition prior to rheology modification. The compositions can be used to make a variety of articles of manufacture, such as automotive parts, non-automotive parts, coating membranes, and boat shafts, via conventional processes.
